General Services Administration
Federal Supply Service
Authorized Federal Supply Schedule Price List

On-line access to contract ordering information, terms and conditions, up-to-date pricing, and the option to create an electronic deliver order are available through GSA Advantage!, a menu-driven database system.

The INTERNET address GSA Advantage! is: www.GSAAdvantage.gov

Schedule Title: Multiple Award Schedule (MAS)

FSC Group, Part, and Section or Standard Industrial Group (as applicable):
Information Technology

FSC Class:

Contract Number: 47QTCA21D00D8

For more information on ordering from Federal Supply Schedules click on the FSS Schedules button at www.fss.gsa.gov

Contract Period: August 5, 2021 to August 4, 2026

Contractor's Name: RestonLogic, LLC

Contractors Address: 607 Smartts Lane NE, Leesburg, VA 20176-6608

Contractors Phone: 703-402-6105

Contractors Fax: 703-402-6105

Contract Administrator: John P McNicholas

Business Size and Status: Small Business, 8a Certified

This price list is effective upon award August 5, 2021

Prices Shown Herein are Net (discount deducted)

LABOR CATEGORIES and PRICING ......................................................22

SCLS STATEMENT ........................................................................24
CUSTOMER INFORMATION:

1a. Table of awarded special item number(s): 518210C, Cloud and Cloud-Related IT Professional Services

1b. Identification of the lowest priced model: No products offered

1c. Hourly Rates: See page 10 for labor category descriptions and rates

2. Maximum order: $500,000.00

3. Minimum order: $100.00

5. Point(s) of Production: Metro Washington DC

6. Discount from List Prices: Government Net Prices (discounts already deducted)

7. Quantity Discounts: None

8. Prompt payment terms: 1% discount on a Net 20 day payment.

9. Foreign items: Not applicable

10a. Time of delivery: To be determined at Task Order Level

10b. Expedited Delivery: To be determined at Task Order Level

10c. Overnight and 2-day delivery: Overnight and 2-day deliveries are available on certain items to be determined at Task Order Level.

10d. Urgent Requirements: The Contractor notes the “Urgent Requirements” clause in its contract. Please contact us for details.

11. F.O.B. point: Destination

12a. Ordering address: 607 Smartts Lane NE, Leesburg, VA 20176-6608

12b. Ordering procedures: For supplies and services, the ordering procedures, information on Blanket Purchase Agreements (BPA’s) are found in Federal Acquisition Regulation (FAR) 8.405-3.

13. Payment address: 607 Smartts Lane NE, Leesburg, VA 20176-6608
14. **Warranty provision**: The ordering activity should include the criteria for satisfactory completion for each task in the Statement of Work or Delivery Order. Services shall be completed in a good and workmanlike manner.

15. **Export packing charges**: Not applicable

16. **Terms and conditions of rental, maintenance, and repair**: Not applicable

17. **Terms and conditions of installation**: Not applicable

18a **Terms and conditions of repair parts**: Not applicable

18b **Terms and conditions other services**: Not applicable

19. **List of service and distribution points**: Not applicable

20. **List of participating dealers**: Not applicable

21. **Preventive maintenance**: Not applicable

22a. **Special attributes such as environmental attributes**: Not applicable

22b. **Section 508 compliance information is available**: On contractors’ web site

23. **Data Universal Number System (DUNS) number**: 059642212

24. **Notification**: Contractor is registered in the SAM database and active.
Specific Information for Offerors

Table 1: Cloud Computing Services (i.e. IaaS, etc.)

<table>
<thead>
<tr>
<th>SIN Description</th>
<th>Sub-Categories</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Commercially available cloud computing services</td>
<td>1. <strong>Software as a Service (SaaS)</strong>: Consumer uses provider’s applications on cloud infrastructure. Does not manage/control platform or infrastructure. Limited application level configuration may be available.</td>
</tr>
<tr>
<td>• Meets the National Institute for Standards and Technology (NIST) definition of Cloud Computing essential characteristics</td>
<td>2. <strong>Platform as a Service (PaaS)</strong>: Consumer deploys applications onto cloud platform service using provider-supplied tools. Has control over deployed applications and some limited platform configuration but does not manage the platform or infrastructure.</td>
</tr>
<tr>
<td>• Open to all deployment models (private, public, community or hybrid), vendors specify deployment models</td>
<td>3. <strong>Infrastructure as a Service (IaaS)</strong>: Consumer provisions computing resources. Has control over OS, storage, platform, deployed applications and some limited infrastructure configuration, but does not manage the infrastructure.</td>
</tr>
</tbody>
</table>

**NOTE:** Offerors may optionally select the single sub-category that best fits each cloud service offering, per Service Model Guidance, or select no sub-category if the offering does not fit an existing NIST service model.

1) DESCRIPTION OF CLOUD COMPUTING SERVICES (i.e. IaaS, etc.) AND PRICING
a) The information provided below is designed to assist Offerors in qualifying cloud computing services and provide complete descriptions.

b) In addition to standard pricing requirements, all pricing models must have the core capability to meet the NIST Essential Cloud Characteristics, particularly with respect to on-demand self-service, while allowing alternate variations at the task order level at agency discretion, pursuant to the guidance on NIST Essential Characteristics.

Table 2 summarizes the additional Offeror provided description requirements for services proposed under the Cloud Computing Services (i.e. IaaS, etc.). All mandatory description requirements must be complete, and adequate according to evaluation criteria.

In addition there is one “Optional” reporting descriptions which exists to provide convenient service selection by relevant criteria. Where provided, optional description requirements must be complete and adequate according to evaluation criteria:

1) The NIST Service Model provides sub-categories for the Cloud SIN and is strongly encouraged, but not required. The Service Model based sub-categories provide this SIN with a structure to assist ordering activities in locating and comparing services of interest. Contractors may optionally select the single service model most closely corresponding to the specific service offering.

2) If a sub-category is selected it will be evaluated with respect to the NIST Service Model definitions and guidelines in “Guidance for Contractors”.
### Table 2: Cloud Service Description Requirements

<table>
<thead>
<tr>

<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Provide a brief written description of how the proposed cloud computing services (i.e. IaaS, etc.) satisfies each individual essential NIST Characteristic</td>
<td>Mandatory</td>
<td>The cloud service must be capable of satisfying each of the five NIST essential Characteristics as outlined in NIST Special Publication 800-145. See ‘GUIDANCE FOR CONTRACTORS: NIST Essential Characteristics’ below in this document for detailed overall direction, as well as guidance on inheriting essential characteristics. The NIST “Measured Service” characteristic requires a minimal “pay as you go” unit of measurement appropriate for the service. In the case of SaaS, the appropriate maximum measured increment of service shall be no more than 30 days per user, or some other equivalent discrete measurement that provides the government with the advantage of frequent (approximately every 30 days) “pay as you go” metering cycles. SaaS products, where consumption is only measured on an annual basis, may better fit under “Term Software License” SIN 132-32. Likewise, offers of any combinations of IaaS, PaaS or any other cloud product services in a bundle or other fashion that do not meet the frequency requirements of approximately 30-day measurement and billing cycles, will not be accepted as complying with the NIST Measured Service characteristic.</td>
</tr>
</tbody>
</table>
2) GUIDANCE FOR OFFERORS

This section offers guidance for interpreting the Contractor Description Requirements in Table 2 (above) including the NIST essential cloud characteristics, service models and deployment models. This section is not a list of requirements.

Offeror specific definitions of cloud computing characteristics and models or significant variances from the NIST essential characteristics or models are discouraged and will not be considered in the scope of this SIN or accepted in response to evaluation factors. The only applicable cloud characteristics, service model/subcategories and deployment models for this SIN will be drawn from the NIST 800-145 special publication. Services qualifying for listing as cloud computing services (i.e. IaaS, etc.) under this SIN must substantially satisfy the essential characteristics of cloud computing as documented in the NIST Definition of Cloud Computing SP 800-145

Offerors must select deployment models corresponding to each way the service can be deployed. Multiple deployment model designations for a single cloud service are permitted but at least one deployment model must be selected.

Both Cloud service model (i.e. IaaS, etc.) and deployment model (i.e. public, etc.) designations must accord with NIST definitions. Guidance is offered in this document on making the most appropriate selection

a) NIST Essential Characteristics

| General Guidance |

NIST’s essential cloud characteristics provide a consistent metric for whether a service is eligible for inclusion in this SIN. It is understood that due to legislative, funding and other constraints that government entities cannot always leverage a cloud service to the extent that all NIST essential characteristics are commercially available. For the purposes of the Cloud SIN, meeting the NIST essential characteristics is determined by whether each essential capability of the commercial service is available for the service, whether or not the Ordering Activity actually requests or implements the capability. The guidance in Table 3 offers examples of how services might or might not be included based on the essential characteristics, and how the Contractor should interpret the characteristics in light of current government contracting processes.
<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Capability</th>
<th>Guidance</th>
</tr>
</thead>
</table>
| On-demand self-service      | ● Ordering activities can directly provision services without requiring Contractor intervention.  
                              | ● This characteristic is typically implemented via a service console or programming interface for provisioning | Government procurement guidance varies on how to implement on-demand provisioning at this time.  
Ordering activities may approach on-demand in a variety of ways, including “not-to-exceed” limits, or imposing monthly or other appropriate payment cycles on what are essentially on demand services.  
Services under this SIN must be capable of true on-demand self-service, and ordering activities and Contractors must negotiate how they implement on-demand capabilities in practice at the task order level:  
  ● Ordering activities must specify their procurement approach and requirements for on-demand service  
  ● Contractors must propose how they intend to meet the approach  
  ● Contractors must certify that on-demand self-service is technically available for their service should procurement guidance become available. |
<table>
<thead>
<tr>
<th>Broad Network Access</th>
<th>Resource Pooling</th>
</tr>
</thead>
<tbody>
<tr>
<td>● Ordering activities are able to access services over standard agency networks</td>
<td>● The cloud service must draw from a pool of resources and provide an automated means for the Ordering Activity to dynamically allocate them.</td>
</tr>
<tr>
<td>● Service can be accessed and provisioned using standard devices such as browsers, tablets and mobile phones</td>
<td>● Manual allocation, e.g. manual operations at a physical server farm where Contractor staff configure servers in response to Ordering Activity requests, does not meet this requirement</td>
</tr>
<tr>
<td>● Broad network access must be available without significant qualification and in relation to the deployment model and security domain of the service</td>
<td>● Similar concerns apply to software and platform models; automated provisioning from a pool is required</td>
</tr>
<tr>
<td>● Contractors must specify any ancillary activities, services or equipment required to access cloud services or integrate cloud with other cloud or non-cloud networks and services. For example, a private cloud might require an Ordering Activity to purchase or provide a dedicated router, etc. which is acceptable but should be indicated by the Contractor.</td>
<td>● Ordering activities may request dedicated physical hardware, software or platform resources to access a private cloud deployment service. However the provisioned cloud resources must be drawn from a common pool and automatically allocated on request.</td>
</tr>
<tr>
<td>Resource Pooling</td>
<td></td>
</tr>
<tr>
<td>● Pooling distinguishes cloud services from simple offsite hosting.</td>
<td></td>
</tr>
<tr>
<td>● Ordering activities draw resources from a common pool maintained by the Contractor</td>
<td></td>
</tr>
<tr>
<td>● Resources may have general characteristics such as regional location</td>
<td></td>
</tr>
<tr>
<td>Rapid Elasticity</td>
<td></td>
</tr>
<tr>
<td>------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>● Rapid provisioning and de-provisioning commensurate with demand</td>
<td></td>
</tr>
<tr>
<td>● Rapid elasticity is a specific demand-driven case of self-service</td>
<td></td>
</tr>
<tr>
<td>● ‘Rapid’ should be understood as measured in minutes and hours, not days or weeks.</td>
<td></td>
</tr>
<tr>
<td>● Elastic capabilities by manual request, e.g. via a console operation or programming interface call, are required.</td>
<td></td>
</tr>
<tr>
<td>● Automated elasticity which is driven dynamically by system load, etc. is optional. Contractors must specify whether automated demand-driven elasticity is available and the general mechanisms that drive the capability.</td>
<td></td>
</tr>
</tbody>
</table>
**Measured Service**

- Measured service should be understood as a reporting requirement that enables an Ordering Activity to control their use in cooperation with self service.

- Procurement guidance for on-demand self-service applies to measured service as well, i.e. rapid elasticity must be technically available but ordering activities and Contractors may mutually designate other contractual arrangements.

- Regardless of specific contractual arrangements, reporting must indicate actual usage, be continuously available to the Ordering Activity, and provide meaningful metrics appropriate to the service measured.

- Contractors must specify that measured service is available and the general sort of metrics and mechanisms available.

- The goal of the Measured Service requirement is to ensure Ordering Activities realize the full benefit of “pay as you go” consumption models. Consumption measurements that are not discrete enough or frequent enough (greater than 30 days), will not fulfill this NIST essential characteristic and will not be eligible for inclusion in this SIN.

---

**Inheriting Essential Characteristics**

Cloud Services (i.e. IaaS, etc.) may depend on other cloud services, and cloud service models such as PaaS and SaaS are able to inherit essential characteristics from other cloud services that support them. For example a PaaS platform service can inherit the broad network access made available by the IaaS service it runs on, and in such a situation would be fully compliant with the broad network access essential characteristic. Cloud Services (i.e. IaaS, etc.) inheriting essential characteristics must make the inherited characteristic fully available at their level of delivery to claim the relevant characteristic by inheritance.

Inheriting characteristics does not require the inheriting provider to directly bundle or integrate the inherited service, but it does require a reasonable measure of support and identification. For example, the Ordering Activity may acquire an IaaS service from “Provider A” and a PaaS service from “Provider B”. The PaaS service
may inherit broad network access from “Provider A” but must identify and support the inherited service as an acceptable IaaS provider.

### Assessing Broad Network Access

Typically broad network access for public deployment models implies high bandwidth access from the public internet for authorized users. In a private cloud deployment internet access might be considered broad access, as might be access through a dedicated shared high bandwidth network connection from the Ordering Activity, in accord with the private nature of the deployment model.

### Resource Pooling and Private Cloud

All cloud resource pools are finite, and only give the appearance of infinite resources when sufficiently large, as is sometimes the case with a public cloud. The resource pool supporting a private cloud is typically smaller with more visible limits. A finite pool of resources purchased as a private cloud service qualifies as resource pooling so long as the resources within the pool can be dynamically allocated to the ultimate users of the resource, even though the pool itself appears finite to the Ordering Activity that procures access to the pool as a source of dynamic service allocation.

1) **NIST Service Model**

The Contractor may optionally document the service model of cloud computing (e.g. IaaS, PaaS, SaaS, or a combination thereof, that most closely describes their offering, using the definitions in The NIST Definition of Cloud Computing SP 800-145. The following guidance is offered for the proper selection of service models.

NIST’s service models provide this SIN with a set of consistent sub-categories to assist ordering activities in locating and comparing Cloud services (i.e. IaaS, etc.) of interest. Service model is primarily concerned with the nature of the service offered and the staff and activities most likely to interact with the service. Contractors should select a single service model most closely corresponding to their proposed service based on the guidance below. It is understood that cloud services can technically incorporate multiple service models and the intent is to provide the single best categorization of the service.
Contractors should take care to select the NIST service model most closely corresponding to each service offered. Contractors should not invent, proliferate or select multiple cloud service model sub-categories to distinguish their offerings, because ad-hoc categorization prevents consumers from comparing similar offerings. Instead vendors should make full use of the existing NIST categories to the fullest extent possible.

For example, in this SIN an offering commercially marketed by a Contractor as “Storage as a Service” would be properly characterized as Infrastructure as a Service (IaaS), storage being a subset of infrastructure. Services commercially marketed as “LAMP as a Service” or “Database as a Service” would be properly characterized under this SIN as Platform as a Service (PaaS), as they deliver two kinds of platform services. Services commercially marketed as “Travel Facilitation as a Service” or “Email as a Service” would be properly characterized as species of Software as a Service (SaaS) for this SIN.

However, Contractors can and should include appropriate descriptions (including commercial marketing terms) of the service in the full descriptions of the service’s capabilities.

When choosing between equally plausible service model sub-categories, Contractors should consider several factors:

a) Visibility to the Ordering Activity. Service model sub-categories in this SIN exist to help Ordering Activities match their requirements with service characteristics. Contractors should select the most intuitive and appropriate service model from the point of view of an Ordering Activity.

b) Primary Focus of the Cloud Service (i.e. IaaS, etc.). Services may offer a mix of capabilities that span service models in the strict technical sense. For example, a service may offer both IaaS capabilities for processing and storage, along with some PaaS capabilities for application deployment, or SaaS capabilities for specific applications. In a service mix situation the Contractor should select the service model that is their primary focus. Alternatively contractors may choose to submit multiple service offerings for the SIN, each optionally and separately subcategorized.

c) Ordering Activity Role. Contractors should consider the operational role of the Ordering Activity's primary actual consumer or operator of the service. For example services most often consumed by system managers are likely to fit best as IaaS; services most often
consumed by application deployers or developers as PaaS, and services most often consumed by business users as SaaS.

d) Lowest Level of Configurability. Contractors can consider IaaS, PaaS and SaaS as an ascending hierarchy of complexity, and select the model with the lowest level of available Ordering Activity interaction. As an example, virtual machines are an IaaS service often bundled with a range of operating systems, which are PaaS services. The Ordering Activity usually has access to configure the lower level IaaS service, and the overall service should be considered IaaS. In cases where the Ordering Activity cannot configure the speed, memory, network configuration, or any other aspect of the IaaS component, consider categorizing as a PaaS service.

Cloud management and cloud broker services should be categorized based on their own characteristics and not those of the other cloud services that are their targets. Management and broker services typically fit the SaaS service model, regardless of whether the services they manage are SaaS, PaaS or IaaS. Use Table 3 to determine which service model is appropriate for the cloud management or cloud broker services, or, alternately choose not to select a service model for the service.

The guidance in Table 4 offers examples of how services might be properly mapped to NIST service models and how a Contractor should interpret the service model sub-categories.
Table 4: Guidance on Mapping to NIST Service Models

<table>
<thead>
<tr>
<th>Service Model</th>
<th>Guidance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infrastructure as a Service (IaaS)</td>
<td>Select an IaaS model for service based equivalents of hardware appliances such as virtual machines, storage devices, routers and other physical devices.</td>
</tr>
<tr>
<td></td>
<td>● IaaS services are typically consumed by system or device managers who would configure physical hardware in a non-cloud setting</td>
</tr>
<tr>
<td></td>
<td>● The principal customer interaction with an IaaS service is provisioning then configuration, equivalent to procuring and then configuring a physical device.</td>
</tr>
<tr>
<td></td>
<td>Examples of IaaS services include virtual machines, object storage, disk block storage, network routers and firewalls, software defined networks.</td>
</tr>
<tr>
<td></td>
<td>Gray areas include services that emulate or act as dedicated appliances and are directly used by applications, such as search appliances, security appliances, etc. To the extent that these services or their emulated devices provide direct capability to an application they might be better classified as Platform services (PaaS). To the extent that they resemble raw hardware and are consumed by other platform services they are better classified as IaaS.</td>
</tr>
</tbody>
</table>
Select a PaaS model for service based equivalents of complete or partial software platforms. For the purposes of this classification, consider a platform as a set of software services capable of deploying all or part of an application.

- A complete platform can deploy an entire application. Complete platforms can be proprietary or open source
- Partial platforms can deploy a component of an application which combined with other components make up the entire deployment
- PaaS services are typically consumed by application deployment staff whose responsibility is to take a completed agency application and cause it to run on the designated complete or partial platform service
- The principal customer interaction with a PaaS service is deployment, equivalent to deploying an application or portion of an application on a software platform service.
- A limited range of configuration options for the platform service may be available.

Examples of complete PaaS services include:

- A Linux/Apache/MySQL/PHP (LAMP) platform ready to deploy a customer PHP application,
- A Windows .Net platform ready to deploy a .Net application,
- A custom complete platform ready to develop and deploy a customer application in a proprietary language
- A multiple capability platform ready to deploy an arbitrary customer application on a range of underlying software services.

The essential characteristic of a complete PaaS is defined by the customer’s ability to deploy a complete custom application directly on the platform.

PaaS includes partial services as well as complete platform services. Illustrative examples of individual platform enablers or components include:

- A database service ready to deploy a customer’s tables, views and procedures,
● A queuing service ready to deploy a customer’s message definitions

● A security service ready to deploy a customer’s constraints and target applications for continuous monitoring

The essential characteristic of an individual PaaS component is the customer’s ability to deploy their unique structures and/or data onto the component for a partial platform function.

Note that both the partial and complete PaaS examples all have two things in common:

● They are software services, which offer significant core functionality out of the box

● They must be configured with customer data and structures to deliver results

As noted in IaaS, operating systems represent a gray area in that OS is definitely a platform service, but is typically bundled with IaaS infrastructure. If your service provides an OS but allows for interaction with infrastructure, please sub-categorize it as IaaS. If your service “hides” underlying infrastructure, consider it as PaaS.
Software as a Service (SaaS)

Select a SaaS model for service based equivalents of software applications.

- SaaS services are typically consumed by business or subject-matter staff who would interact directly with the application in a non-cloud setting.
- The principal customer interaction with a SaaS service is actual operation and consumption of the application services the SaaS service provides.

Some minor configuration may be available, but the scope of the configuration is limited to the scope and then the permissions of the configuring user. For example an agency manager might be able to configure some aspects of the application for their agency but not all agencies. An agency user might be able to configure some aspects for themselves but not everyone in their agency. Typically only the Contractor would be permitted to configure aspects of the software for all users.

Examples of SaaS services include email systems, business systems of all sorts such as travel systems, inventory systems, etc., wiki’s, websites or content management systems, management applications that allow a customer to manage other cloud or non-cloud services, and in general any system where customers interact directly for a business purpose.

Gray areas include services that customers use to configure other cloud services, such as cloud management software, cloud brokers, etc. In general these sorts of systems should be considered SaaS, per guidance in this document.

2) Deployment Model

Deployment models (e.g. private, public, community, or hybrid) are not restricted at the SIN level and any specifications for a deployment model are the responsibility of the Ordering Activity.

Multiple deployment model selection is permitted, but at least one model must be selected. The guidance in Table 4 offers examples of how services might be properly mapped to NIST deployment models and how the Contractor should interpret the deployment model characteristics. Contractors should take care to select the range of NIST deployment models most closely corresponding to each service offered.

Note that the scope of this SIN does not include hardware or software components used to construct a cloud, only cloud capabilities delivered as a service, as noted in the Scope section.
<table>
<thead>
<tr>
<th>Deployment Model</th>
<th>Guidance</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Private Cloud</strong></td>
<td>The service is provided exclusively for the benefit of a definable organization and its components; access from outside the organization is prohibited. The actual services may be provided by third parties, and may be physically located as required, but access is strictly defined by membership in the owning organization.</td>
</tr>
<tr>
<td><strong>Public Cloud</strong></td>
<td>The service is provided for general public use and can be accessed by any entity or organization willing to contract for it.</td>
</tr>
<tr>
<td><strong>Community Cloud</strong></td>
<td>The service is provided for the exclusive use of a community with a definable shared boundary such as a mission or interest. As with private cloud, the service may be in any suitable location and administered by a community member or a third party.</td>
</tr>
<tr>
<td><strong>Hybrid Cloud</strong></td>
<td>The service is composed of one or more of the other models. Typically hybrid models include some aspect of transition between the models that make them up, for example a private and public cloud might be designed as a hybrid cloud where events like increased load permit certain specified services in the private cloud to run in a public cloud for extra capacity, e.g. bursting.</td>
</tr>
</tbody>
</table>
Title: Cloud Consultant  
Rate: 100.76

**Functional Requirements:** Coordinate and/or perform additions and changes to Cloud IT network services and operating systems, and attached devices; includes investigation, analysis, recommendation, configuration, installation, and testing of new network hardware and software. Provide direct support in the day-to-day operations on network hardware and operating systems, including the evaluation of system utilization, monitoring response time and primary support for detection and correction of operational problems. Run and troubleshoot automation tools and perform monitoring and log analysis. Establish network communications between services such as additional firewall ports. Maintain cloud infrastructure standards including tools such as Terraform and Cloud Formation. Provide technical consultation, training and support to using service ticketing systems such as Service Now.

**Minimum Education:** AA/AS

**Minimum Experience:** 2 years

---

Title: Senior Cloud Consultant  
Rate: $134.01

**Functional Requirements:** Analyzes and refines Cloud IT systems requirements. Translates systems requirements into applications prototypes. Plans and designs systems architecture including pricing and substituting with cloud native solutions. Understands strengths, patterns and anti-patterns of major cloud services including infrastructure as code solutions. Determines and designs applications architecture. Interfaces and presents solutions and designs to stakeholders and business leads. Works with customers to test applications. Assures software and systems quality and functionality. Integrates hardware and software components. Writes and maintains program documentation. Evaluates new applications software technologies; and/or ensures the rigorous application of information security/information assurance policies, principles, and practices to the delivery of application software services.

**Minimum Education:** BA/BS

**Minimum Experience:** 7 years

---

Title: Senior Cloud Security Consultant  
Rate: $144.08

**Functional Requirements:** Develops policies and procedures to ensure in the Cloud IT environment information systems reliability and accessibility and to prevent and defend against unauthorized access to systems, networks, and data. Conducts risk and vulnerability assessments of planned and installed information systems to identify vulnerabilities, risks, and protection needs. Promotes...
awareness of security issues among management and ensuring sound security principles are reflected in organizations’ visions and goals. Conducts systems security evaluations, audits, and reviews. Develops systems security contingency plans and disaster recovery procedures. Develops and implements programs to ensure that systems, network, and data users are aware of, understand, and adhere to systems security policies and procedures. Participates in network and systems design to ensure implementation of appropriate systems security policies. Facilitates the gathering, analysis, and preservation of evidence used in the prosecution of computer crimes. Assesses security events to determine impact and implementing corrective actions; and/or ensures the rigorous application of information security/information assurance policies, principles, and practices in the delivery of all IT services.

**Minimum Education**: BA/BS

**Minimum Experience**: 7 Years

**Title**: Data Engineer

**Rate**: $123.93

**Functional Requirements**: Apply an enterprise-wide set of disciplines for the planning, analysis, design, and construction of information systems on an enterprise-wide basis or across a major sector of the enterprise in the Cloud IT environment. Develop analytical and computational techniques and methodology for problem solutions. Perform enterprise-wide strategic systems planning, business information planning, business, and analysis. Perform process and data modeling in support of the planning and analysis efforts using both manual and automated tools, such as Integrated Computer-Aided Software Engineering tools. Apply reverse engineering and re-engineering disciplines to develop migration strategic and planning documents. Provide technical guidance in software engineering techniques and automated support tools. Provide daily supervision and direction to staff. Possesses knowledge of applying analytic methodologies and principles to address project needs. Serves as a member of the consulting team performing analytical tasks and technical team assignments; performs research, support, and reporting functions.

**Minimum Education**  BS/BA

**Minimum Experience**  5 years

**Experience substitution for Education**

It is Reston Logic policy to allow experience to be substituted for education on the following basis:

- AS/AA:  4 years
- BA/BS degree:  6 years

Experience substituted for education requirements must be in addition to the experience required to qualify for the labor category.
SCLS STATEMENT

The Service Contract Labor Standards (SCLS) are applicable to this contract and they apply to the entire MAS Schedule and all services provided. While no specific labor categories have been identified as being subject to SCLS due to exemptions for professional employees (FAR 22.1101, 22.1102 and 29CRF 5413.300), this contract still maintains the provisions and protections for SCLS eligible labor categories. If and/or when the Contractor adds SCLS labor categories / employees to the contract through the modification process, the Contractor must inform the Contracting Officer and establish a SCLS matrix identifying the GSA labor category titles, the occupational code, SCLS labor category titles and applicable wage determination (WD) number. Failure to do so may result in cancellation of the contract.
